

# MODULE 7

- Welfare

- Ex.:

Consumer	willing to pay	Firm	Cost
1	10	1	2
2	8	2	3
3	7	3	7
4	5	4	9

$$EQ: P = 7 \quad Q = 3$$

$$\text{Consumer surplus: } (10 - 7) + (8 - 7) = 3 + 1 = 4$$

$$\text{Firm surplus: } (7 - 2) + (7 - 3) = 5 + 4 = 9$$

$$\text{Total surplus: } 4 + 9 = 13$$

- Let's look for the general case

Look at • There are consumers that would buy the good for 7

Look at • there are firms which would sell the good for 3

Hence, The Economic surplus is

/// Cons surplus +  
/// Prod. surplus  

---

Total surplus

## Math

- Consumers: When  $Q_0 = 0$ ,  $P_0 = 10$ 
  - we use the triangle area formula

$$\frac{b \cdot h}{2} \quad b = P_0 - P^* = 5 \quad ; \quad \frac{20 \cdot 5}{2} = 50$$
$$h = Q^* = 20$$

- Firms: When  $Q_0 = 0$ ,  $P_0 = 1$

$$b = P^* - P_0 = 5 - 1 = 4 \quad ; \quad \frac{20 \cdot 4}{2} = 40$$
$$h = Q^* = 20$$

- Total: Prod. + Cons =  $50 + 40 = 90$

## Roadmap

① Identify Supply and Demand

② Assume  $Q=0 \Rightarrow$  Plug in the  $D \Rightarrow$  find  $P_0^D$   
Assume  $Q=0 \Rightarrow$  Plug in the  $S \Rightarrow$  find  $P_0^S$

③ Find  $EQ \Rightarrow P^E, Q^E$

④ Calculate the triangles

Cons surplus  $b = Q^E, h = P_0^D - P^E$

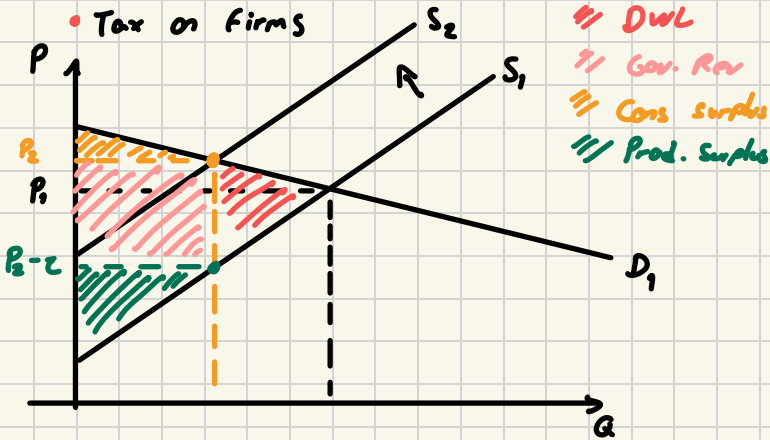

Prod surplus  $b = Q^E, h = P^E - P_0^S$

⑤ Apply the  $\Delta$  Area Formula

$$\frac{b \cdot h}{2}$$

# Taxes

• Tax on Firms

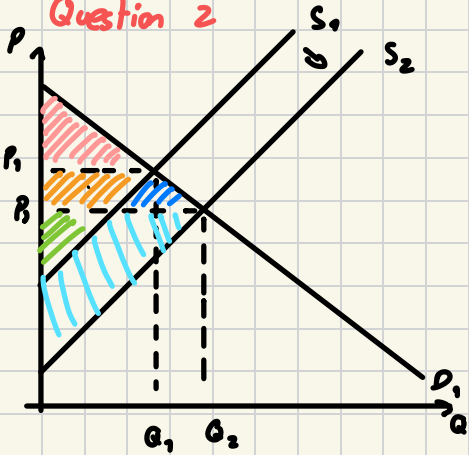

# Question 1

/// Cons. Surplus  
/// Prod. Surplus

# Question 2

- Red hatching → 1
- Orange hatching → 2
- Green hatching → 3
- Blue hatching → 4
- Light blue hatching → 5

Before

After

Consumers

$$1 < 1 + 2 + 4$$

Firms

$$2 + 3 <^* 3 + 5$$

Total

$$1 + 2 + 3 < 1 + 2 + 4 + 3 + 5$$

Cons. Surplus  $\uparrow$

Prod. Surplus ?

Total Surplus  $\uparrow$

\* This is true because the shift is parallel

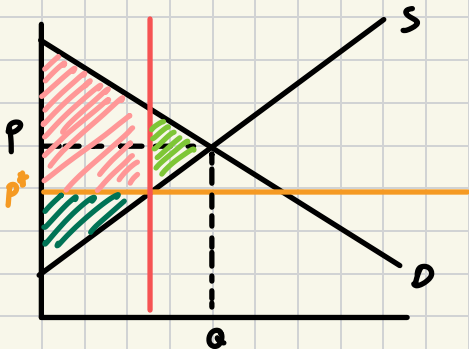

### Question 3

- By Decreasing marginal utility, utility of unit  $i$  should be greater than of unit  $i+1$

Unit	Marginal Benefit
1	1.00
2	0.80
3	0.6
4	0.4
5	0.2

$$\begin{aligned} & (1 - 0.5) + (0.8 - 0.5) \\ & + (0.6 - 0.5) = 0.5 + 0.3 + 0.1 \\ & = 0.9 \end{aligned}$$

# Question 4

/// DWL

/// Cons. Surplus

/// Prod. Surplus

## Question 5

- Demand:  $P = 50 - 10Q$
- Supply:  $P = 10 + \frac{10}{3}Q$
- Equilibrium:

$$50 - 10Q = 10 + \frac{10}{3}Q$$

$$40 = \frac{40}{3}Q$$

$$Q^* = 3 \Rightarrow P^* = 50 - 10 \cdot 3 = 20$$

- Consumer surplus

- Demand:  $Q_0 = 0 \Rightarrow P_0 = 50$

- b:  $P_0 - P^* = 50 - 20 = 30$

- h:  $Q^* = 3$

$$\frac{b \cdot h}{2} = \frac{30 \cdot 3}{2} = 45$$

- Producer Surplus

- Supply:  $Q_0 = 0 \Rightarrow P_0 = 10$

- b:  $P^* - P_0 = 30 - 10 = 20$

- h:  $Q^* = 3$

- $$\frac{b \cdot h}{2} = \frac{20 \cdot 3}{2} = 30$$

- Total Surplus:

- $$45 + 30 = 75$$

## Question 6

Suppose  $S$  is perfect Inelastic

After price ceiling

Cons. surplus  +   
Prod. surplus   
Total surplus:  +  + 

This is also true if the  $D$  is perfect inelastic  
or the price ceiling is placed above the eq. Price
